

The Clinical Rationale: The effect that dermal tolerance of hand hygiene agents has on infection rates.

According to published clinical studies, dryness and skin irritation are the leading reasons healthcare workers do not follow their facility's hand hygiene protocol. As a result, the CDC strongly recommends the regular use of products that prevent and treat dryness and irritation.

Low compliance and barriers to hand hygiene stem from skin irritation by hand hygiene agents.

D.Pittet, J. Boyce. Lancet Infectious Diseases 2001, April 19-20.

Less skin irritation leads to better hand hygiene compliance

West, Zhu; "Evaluation of aloe vera gel gloves in the treatment of dry skin associated with occupational exposure," American Journal of Infection Control; 2003, Volume 31, Page 40-42.

Higher compliance percentages lead to decreased infection rates (compliance increased from 48% to 66% while infections dropped from 16.9% to 9.9% when hand hygiene was promoted with emphasis on bedside alcohol disinfecting.)

Didier, Hugonnet, Harbarth, Mourouga, Sauvan, Touveneau, Perneger; The Lancet (2000) 356, 1307-1312

Sterillium Comfort Gel significantly increases skin hydration after only one week of product usage compared to untreated skin*

Sterillium® Comfort Gel™ has been shown to increase skin hydration to combat dry hands.

Sterillium® Comfort Gel™
