

4

steps to effective diabetes management.

With diabetes common in long-term care residents—many who require more resources and suffer complications⁷—we've developed a comprehensive, four-step approach to help you better manage your residents' diabetes.

1 

Test

Accurately monitoring blood glucose levels is crucial to checking if your residents' diabetes is in control and determining adjustments in treatment. Inaccurate readings could impact medication dosage and other therapies.

Our innovative Harmony™ Blood Glucose Monitoring System helps improve resident care with results you can trust. Harmony offers:

- » Improved accuracy
- » A wider hematocrit range
- » No interference with oxygen

It also meets many of the new FDA recommendations.⁷

2 

Treat

Insulin works to manage blood sugar spikes and may help keep sugar levels in balance. Our insulin safety syringes help reduce the risk of needlesticks and cross contamination.

3 

Dispose

According to the CDC, an estimated 385,000 health care workers accidentally stick themselves with needles every year, which could cause serious infection.⁸ Locking sharps containers protect your staff and residents from disposed needles.

4 

Disinfect

Growing evidence shows that the environment plays a direct role in transmitting infectious organisms. EPA-registered Micro-Kill™ disinfectant wipes are approved for cleaning hard non-porous surfaces only and effective against hard-to-kill microorganisms.
