TIME FOR A CHANGE

ReliaFit™: Male urinary management has evolved into something new

The next generation male external urinary device

- Reduces the risk of CAUTIs often caused by indwelling catheters

Consider ReliaFit instead of indwelling catheters:
- For patients without urinary retention or bladder outlet obstruction
- When strict or real-time measurement of urinary output is not required
- For perioperative use:
  - During non-urologic surgery or procedures not involving contiguous structures of the genitourinary tract
  - During surgery of short duration
  - When large-volume infusions or diuretics are not administered
  - When intraoperative monitoring of urine output is not required
- For incontinent patients with open sacral or perineal wounds
- For patients at increased risk of mortality associated with catheterization, such as the elderly or severely ill
- To improve comfort during end-of-life care

Indwelling catheters increase the risk of infection

- Healthcare-associated infections (HAIs) are a major cause of death
- 40% of HAIs are urinary tract infections (UTIs)
- 80% of UTIs are associated with indwelling catheters (CAUTIs)
- CAUTIs lengthen hospital stays and increase treatment costs

CAUTIs significantly impact patients and institutions

Condom catheters can result in leakage, skin breakdown

- Varying male anatomies make external catheterization difficult, especially for retracted or uncircumcised anatomies
- Imperfect sizing and poor adhesion often lead to leaks, patient discomfort
- Moisture-related skin breakdown threatens sensitive skin

Length of stay (+2 - 4 days) Unnecessary use of antimicrobials Cost of inpatient care ($980 - $2900)
ReliaFit™: unique design means superior performance

Urinary management evolved. Problems solved.

Flexible Faceplate: One-size-fits-all design that works on any anatomy (uncircumcised and retracted anatomy) combined with a self-sealing vent to improve drainage.

CathGrip: Added convenience for securing urine drainage tubing to a patient’s leg. Available in CathGrip set only.

Hydrocolloid Seal: Connects device to anatomy in a gentle, skin-friendly manner.

Mastisol®: Sets include Mastisol adhesive to enhance staying power.

- The ReliaFit seal, flexible faceplate, and Cathgrip are all made from a hydrocolloid material, adding to patient comfort

Leak prevention, ease of use, and patient comfort

- Reduces risk of CAUTIs
- Designed for superior leak prevention
- One-size-fits all: works on retracted, circumcised, and uncircumcised anatomies
- Maintains the integrity of sensitive skin by avoiding moisture-related skin breakdown
- Easy to apply and remove, comfortable for the patient

Data Point

Noninvasive ReliaFit helps reduce the risk of CAUTI common with indwelling catheters

0/42

In a study of 42 applications of ReliaFit by 31 RNs in 20 acute-care patients, 0 urinary tract infections were reported.

We are like every facility in the nation trying to reduce infections: Any time we can keep a Foley catheter from being inserted we are more than happy to do that. Anything external that would provide good security so that we can avoid skin irritation for patients, we would be interested.

Infection Control Preventionist (ICP)
Minimizes CAUTI risk and leakage, maximizes comfort and ease of use

ReliaFit reduces the significant risk of CAUTIs associated with indwelling catheters

- Noninvasive design
- NO UTIs demonstrated during a study of 42 device applications

ReliaFit offers a superior alternative to condom catheters

- One-size-fits-all
- Unparalleled leak prevention
- Better skin integrity protection
- Easy to use, comfortable for patients

Improve the quality of the care you deliver with ReliaFit

- ReliaFit may improve outcomes, enhance the hospital experience, and raise patient satisfaction

Consider ReliaFit as an alternative to condom catheters and indwelling catheters for many patients
